Introduction

HepcoMotion® has updated the highly successful Heavy Duty Slide System, retaining the best features from the previous system, and incorporating them in a greatly expanded range under the name of HDS2. Many new components have been added including larger bearings, with increased load capacity, two sizes of construction beam, single edge V slides and flat track, as well as a range of drive options. All this, with an option for stainless steel or corrosion resistant components as standard, enables the HDS2 range to offer a solution for most customer's applications.

Customers can choose from low cost commercial slides for general use or high precision ground slides to suit applications where accuracy and smoothness are key requirements.

Customers can save design and manufacturing time by specifying ready mounted systems complete with rack driven carriages, safe in the knowledge that everything has been designed and tested by one of the world's leading specialists in linear technology.

2D & 3D CAD files available

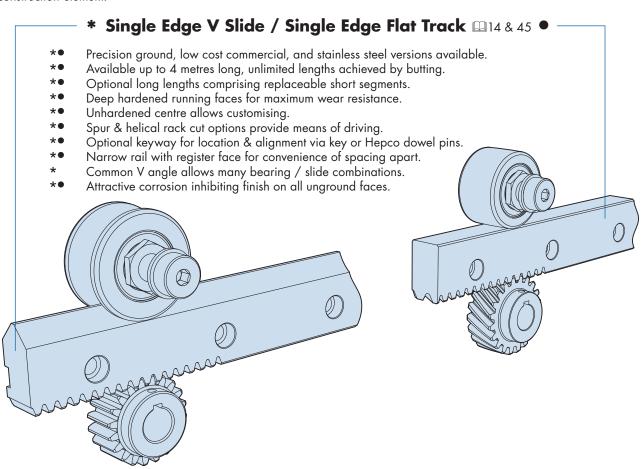

Please visit Hepco for a CAD CD or visit **www.HepcoMotion.com** and select CAD.

Features and Benefits

- Low cost commercial, precision ground and stainless steel systems available.
- Spur or helical rack & pinion options for ease of driving.
- Unique wiping action expels dirt and debris, in harsh environments
- Available as assembled units or in component form, providing maximum flexibility of design.
- Versatile construction beams for multiple design options
- System capacities up to 68 kN.
- Can operate without lubrication, ideal for food machinery and clean applications.
- Slides and tracks available in one piece up to 4 metres long, saves on assembly time.
- Long lengths comprising replaceable segments, reduces downtime in the event of damage.
- Flat tracks overcome necessity for parallel installation.
- Simple alignment facility to achieve parallelism of V slides
- Works in any plane and orientation for unrestricted use in machine construction.

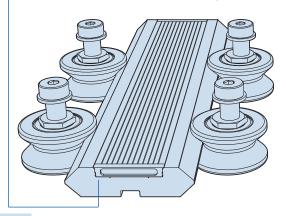

The HDS2 system comprises of a versatile family of slides, flat tracks, construction beams and other components, which will meet the requirements of the most demanding applications.

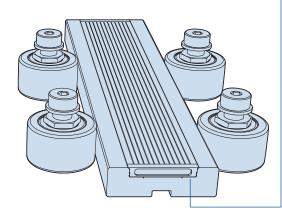

2 to 7 provide an overview of the comprehensive HDS2 system. The slides and flat tracks may be attached to a suitable section, or they may be used in conjunction with Hepco back plates to give a ready made support profile. Slides and flat tracks can also be fitted to Hepco construction beams in many positions to provide a versatile all-in-one guide, drive and construction element.

* Double Edge V Slide / Double Edge Flat Track ☐ 15 & 45 ●

- *• One piece construction with built in parallelism.
- *• Precision ground, low cost commercial, and stainless steel versions available.
- *• Available up to 4 metres long, unlimited lengths achieved by butting.
- *• Optional long lengths comprising replaceable short segments.
- *• Deep hardened running faces for maximum wear resistance.
- *• Unhardened centre allows customising.
- *• Lightened centre with attractive debris cover.
- *• Keyway for location & alignment via key or Hepco dowel pins.
- * Common V angle allows many bearing / slide combinations.
- *• Attractive corrosion inhibiting finish on all unground faces.

V Bearings / Track Rollers ☐ 18-21 ●

Bearing & Roller common features 18-21

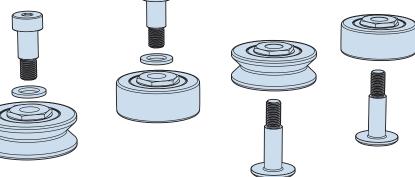

- Special raceway conformity and low radial clearance, for slide applications.
- Double row bearings for tolerance of debris & high load capacity.
- Load capacity up to **50kN** each.
- Can be installed and removed without disengaging the carriage.
- Nitrile sealed for lifetime lubrication & to inhibit ingress of liquids & contaminants.
- All options available in stainless steel.
- Permits out of parallel installation.
- Crowned contact face to overcome misalignment.

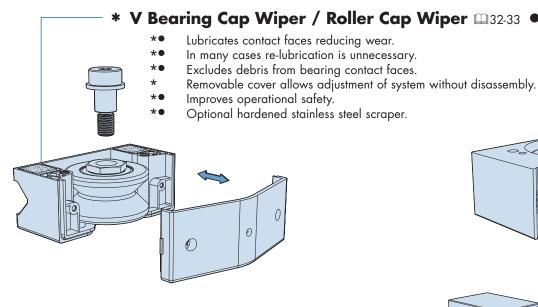

Through hole fixing

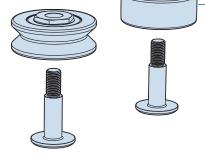

- Bolt lengths to suit plate thickness from 7 to 40mm.
- Concentric (fixed) or eccentric (adjustable) studs.
- Can be installed & removed without carriage disengagement.

- For mounting into thick plates or where access to opposite side is restricted.
- Concentric (fixed) or eccentric (adjustable) studs.
- Can be installed & removed without removing slide.

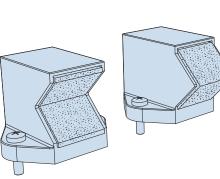

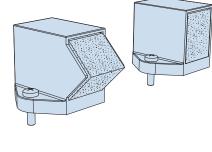

Lubricators 34

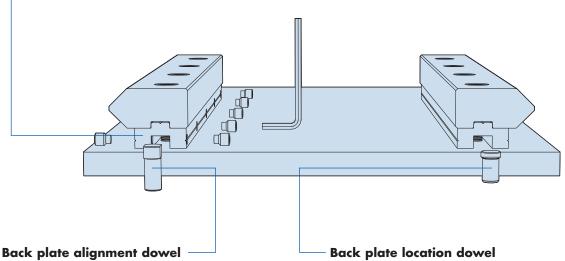

- Lubricates systems increasing load & life.
- Lightly sprung felt wiper ensures low friction.
- Versions to fit slide, track, V bearing & track rollers.
- Blind and through hole fixing.

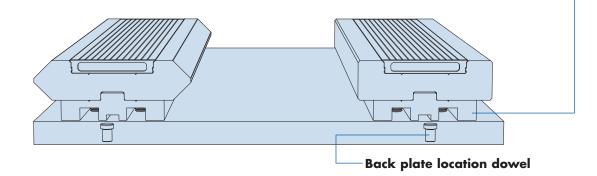

* Low Narrow / Low Wide Back plates □16 •

- *• Strong construction in light weight aluminium.
- *• Profiles to suit single and double edge slides.
- * Adjustable alignment option to obtain parallelism of the system.
- *• Easily incorporated into customers design.
- ***** Will attach to T-slot positions of construction beams.
- *• Key locations for attachment of slide and for mounting.
- *• Supplied clear anodised.
- *• Manufactured to precision extrusion tolerances.

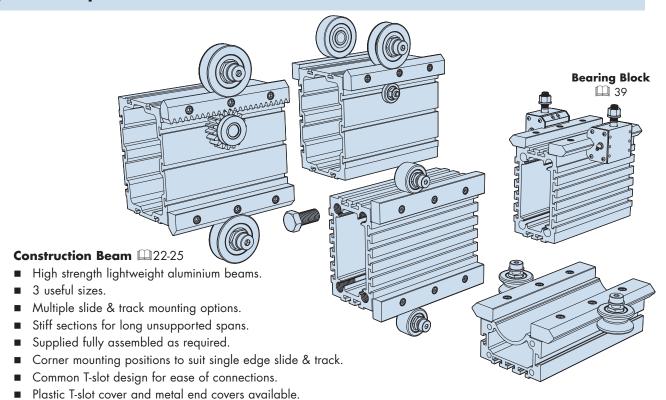

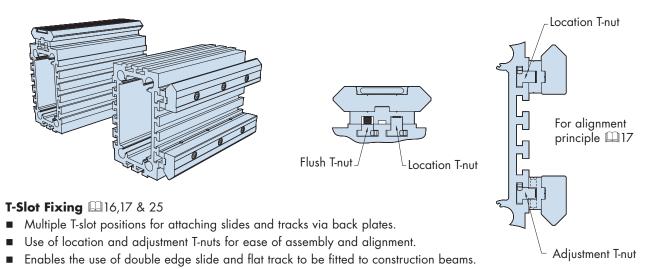

Adjustable alignment in conjunction with jacking screw, ensures parallelism between slides or tracks.

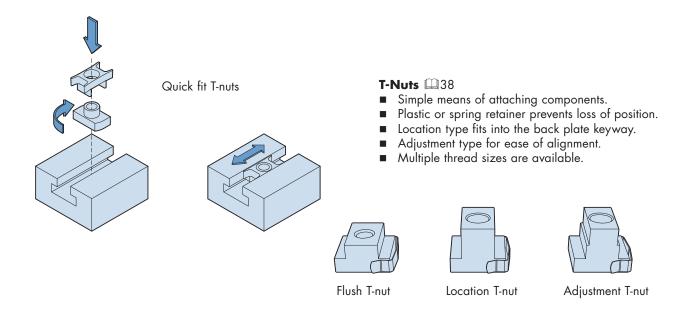

Simple means of location and alignment, provides datum location.

- *• Spaces V slide and flat track away from mounting surface to allow the use of bearings, rollers and cap wipers.
- ***** Male key for location on V slide and flat tracks.
- ***** Female keyway for location using customer own key section, or Hepco dowel pins.
- High wide 🥰 & high narrow 👍 back plates available 16-17 to suit slides with bearing blocks 39

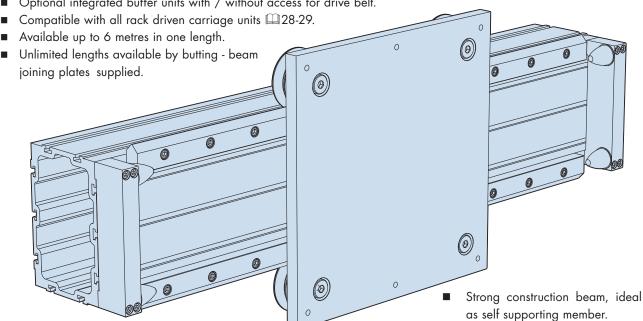

The HDS2 range has been greatly extended to include assembled carriages, 3 sizes of construction beam, larger capacity bearings and a host of improved features. This also provides flexibility for many sizes and types of heavy duty components to be interchanged in order to achieve a comprehensive combination of space and performance possibilities.

Assembled Beams with Carriages 26-27

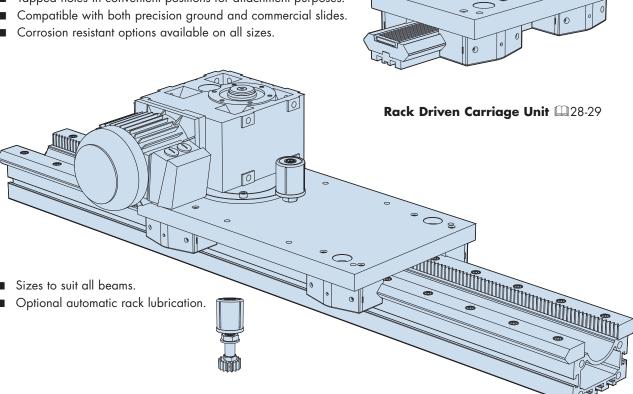

- Fully assembled factory built beam with ready adjusted carriage.
- Available for all opposing corner mounted V slide options for all sizes of beam.

Carriages ■26-27

- Factory adjusted to double edge slide, or beam assembly as required.
- Available with bearings only, or with addition of cap wipers or lubricators.
- Hardened stainless steel scrapers available for cap wipers.
- Tapped holes in convenient positions for attachment purposes.

Hollow centre for belt, cable or

chain return.

HDCS - Heavy Duty Compact Screw Driven Unit

- High performance linear transmission.
- High capacity, high precision.
- Compact high strength aluminium beam.

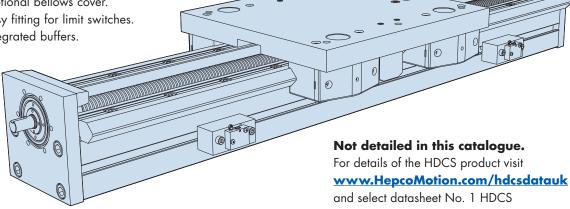

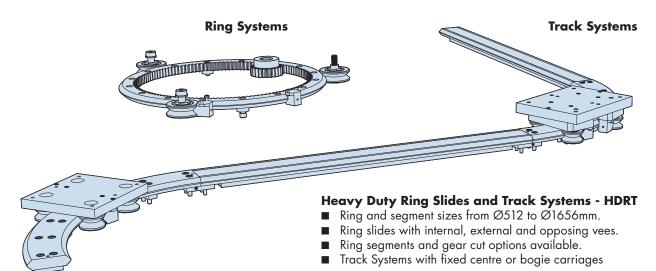

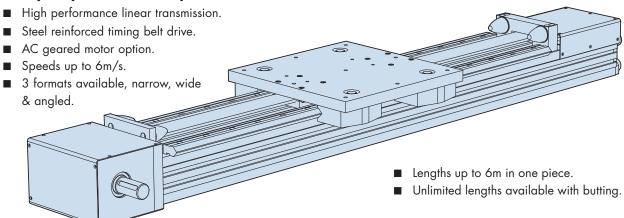

Integrated buffers.

Not detailed in this catalogue. For details of the HDRT product visit www.HepcoMotion.com or request separate catalogue

Heavy Duty Driven Linear System - HDLS

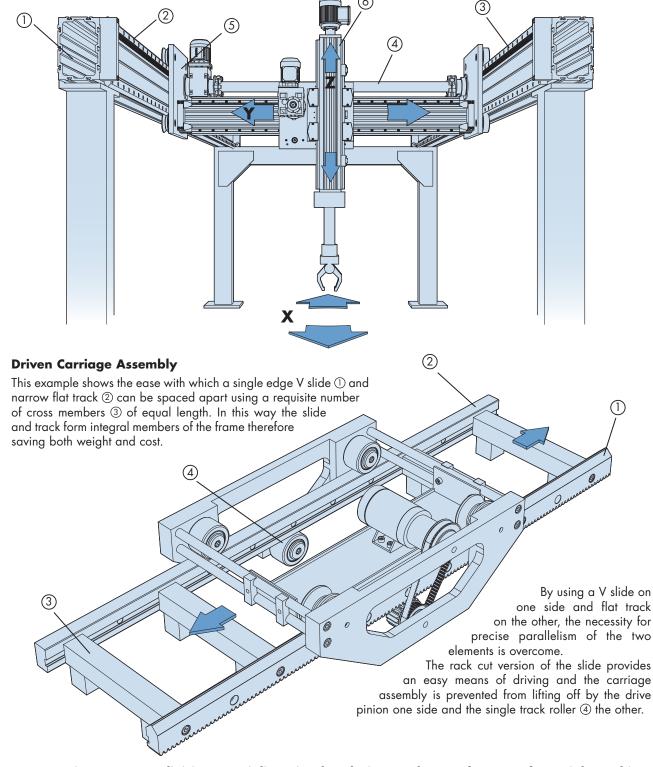

Not detailed in this catalogue. For details of the HDLS product visit www.HepcoMotion.com or request separate catalogue

Application Examples

Gantry Robot

The HDS2 system contains all the major components to produce high capacity gantry systems such as that shown below. The extreme rigidity of the construction beams ① allow for long unsupported spans up to 6m depending on load. The use of V slides ② on one side of the X axis and flat tracks ③ on the other makes allowances for the variation in parallelism between the two beams. The common drive shaft ④ allows for the Y axis to be driven from both X axis beams, via the integrated racks on both the V slide and flat tracks. The ends of the Y axis beam have been tapped to allow direct connection into the driven carriages ⑤ on the X axis. Both X & Y axis beams have been fitted with buffer units for end of stroke protection. The Z axis incorporates a Hepco HDCS unit ⑥, which is driven via a ballscrew, this provides both the precision and capacity required for this type of application.

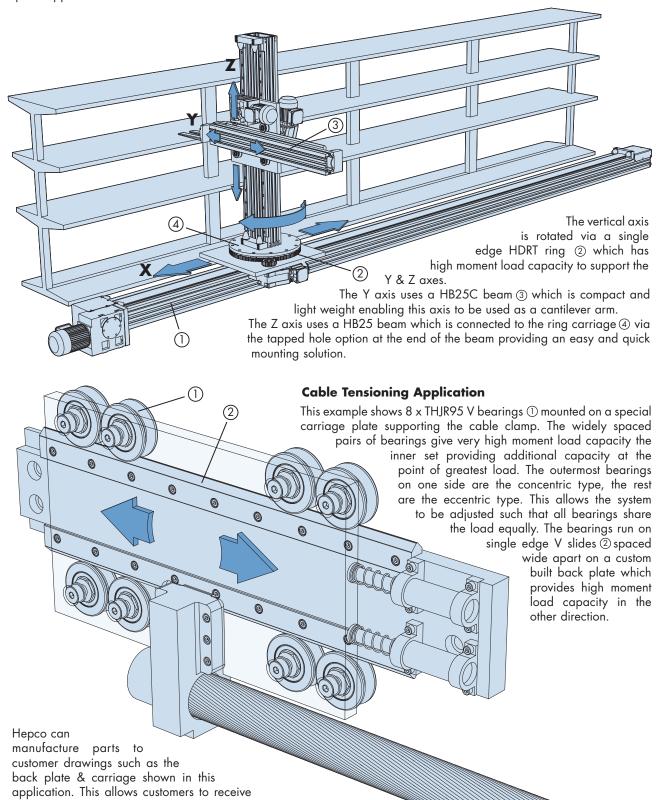

HepcoMotion systems division specialises in the design and manufacture of special machines incorporating its products. Some typical examples are shown above.

Application Examples

Pick and Place Application

This example shows a 4 axis pick and place system using a combination of Hepco HDS2, HDLS and HDRT parts. HDLS & HDRT are related products featured on page 7 and detailed in separate Hepco catalogues. The X axis comprises of the HDLS unit ① which is driven via a steel reinforced timing belt and incorporates an HB25 beam. It is ideally suited to high speed applications of this nature.

HepcoMotion systems division specialises in the design and manufacture of special machines incorporating its products. Some typical examples are shown above.

fully built assemblies, with factory set bearings.

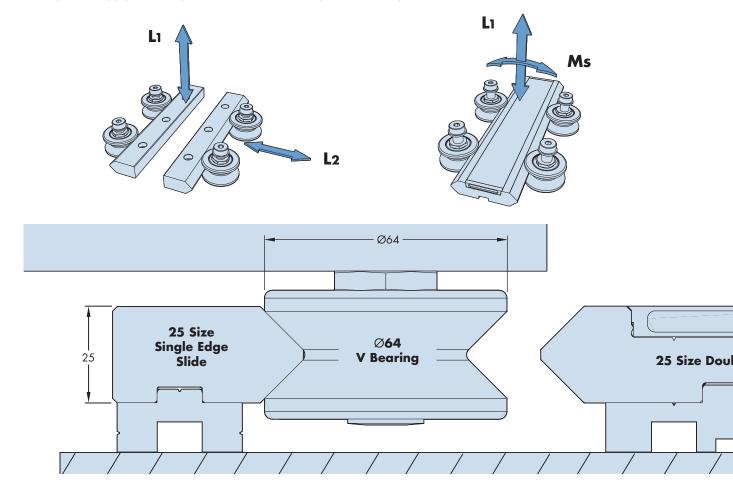

Full Size Illustrations For Initial Selection

Full size illustrations of the basic V slide systems and flat track systems together with load capacity are shown on this and the following 3 pages as a guide to facilitate initial selection. Once a choice has been made, customers should refer to individual component pages for dimensions and to 42-44 for comprehensive details on load and life. Combinations other than shown in this section are possible, please refer to the Mix & Match tables on 46-47. There is a wide range of other components complementary to the V slide systems and flat track systems. These are illustrated on the system composition 2-7 cross referenced to the relevant component pages.

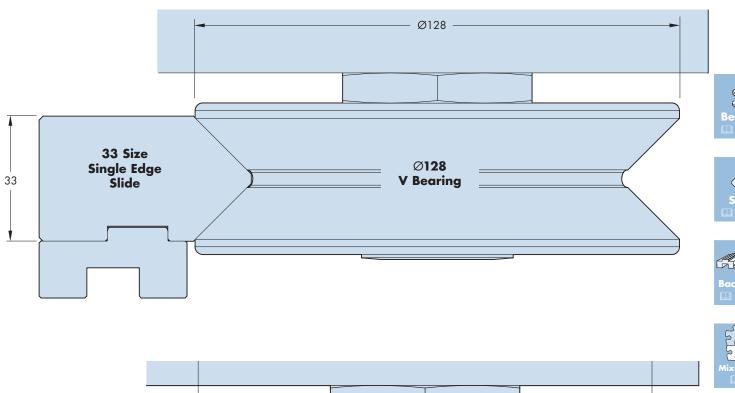

Please note that bearing cap wipers and roller cap wipers are not shown on the illustrations. These will increase the space required very slightly $\square 32$.

Full Size Illustrations For Initial Selection

V Slides & Flat Tracks

Hepco HDS2 V slides and flat tracks are manufactured from high quality bearing steel, hardened on the wearing surfaces. Other areas are left soft for customising. All sizes are available in precision ground, commercial and stainless steel grades. The precision and stainless steel grades are ground on the wearing surfaces and mounting face to provide accuracy and smooth operation. The commercial grade is etched on the wearing surfaces to aid lubrication retention and is suitable for many applications. Single edge slides and tracks are available with a spur or helical rack cut into the rear face. These are also available with a keyway for use with Hepco back plates or dowel pins.

Popular options available on request: Non standard lengths and holes - Butt jointed profiles of unlimited length*2 45 - Matched and replaceable short butted sets 45 - Hardened racks*5

- 1. Any length of slide up to 4046mm long can be supplied in one piece, but for optimum price and delivery, slide lengths should be specified with C & D dimensions as shown in the above table.
- 2. Butt jointed slides of unlimited length are available. The hole pitch will be maintained across the joint. See installation details 🕮 45
- 3. Tooth pitch positions relative to the hole pitch may vary between components. Customers using rack cut profiles in parallel should ensure that one drive pinion can be adjusted relative to the other in order to compensate. Rack cut profiles to a regulated or matched tooth position are available on request.
- 4. Helical racks have a left handed helix angle of 30 degrees.
- 5. Hardened racks are available on request, ..HSS/HTS25 with mod 3 racks are supplied with hardened rack as standard.
- Commercial V slides and flat tracks are manufactured to +0.03 tolerance on width and +0.01 tolerance on thickness, precision and stainless steel versions are manufactured to ±0.025 on both width and thickness. Finish is generally to N5.

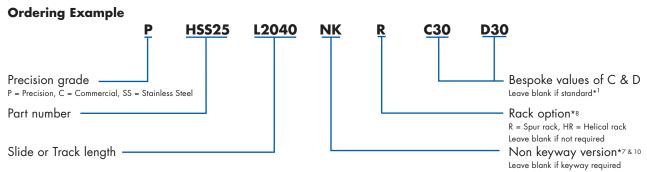

V Slides & Flat Tracks

Hepco double edge slides and wide flat tracks have built in parallelism for ease of setting. Both are supplied with flush fitting plastic covers and end caps to prevent entrapment of debris. Double edge slides and wide flat tracks are supplied with a keyway for locating to a key register, Hepco dowel pins or back plates. Stainless steel versions are available and have a slightly different design, without the central recess or plastic cover and with mounting holes and counterbores to suit M8 cap head screws to DIN912.

Notes:

- 7. Single edge slides & flat tracks for corner mounting to Hepco beams should be ordered without keyway 'NK' 224. The keyway version is useful for customers own location requirements and is necessary when using Hepco back plates 16 & 25.
- 8. HSS & HTS 25 slide and flat tracks have an option of 2.5 or 3 module spur rack. 2.5 module rack is supplied as standard when 'R' is added to the part number. If 3 module rack is required add 3 after 'R' to confirm size required. Helical racks are not available for stainless steel slides or flat tracks.
- M8 low head cap screws are available from Hepco in the following lengths: 30mm (part no. FS8-30) for use without back plate, 40mm (part no. FS8-40) for use with low back plates & 60mm (part no. FS8-60) for use with high back plates. HSS and HTS slides and tracks can use widely available standard M8 & M12 capscrews DIN 912.
- 10. Standard double edge V slides and flat tracks are not available in 'NK' version.

Pinions

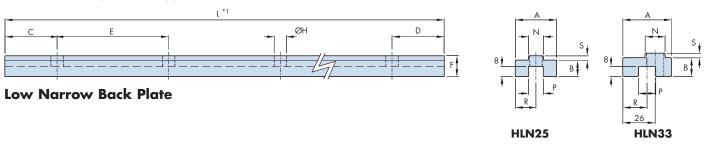

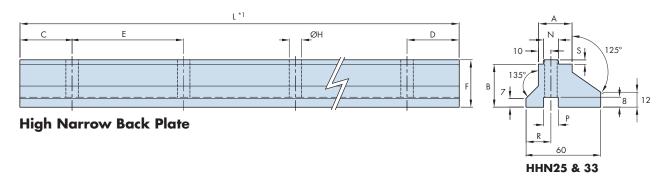

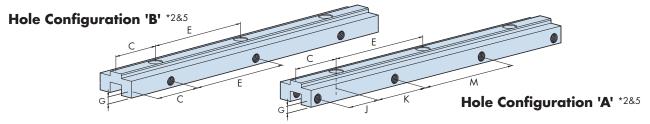

Back Plates

HDS2 back plates are designed to space the V slides and flat tracks off the mounting surface, providing clearance to accommodate the V bearings and track rollers plus their respective lubrication devices 47. They may be used either within the customer's own machine design or in conjunction with the construction beams 🕮 25. The male key section is designed to locate in the optional keyway of the slide and flat tracks whilst the female keyway section(s) are designed to locate either with the customer's own key section or with Hepco dowel pins. The HHN25 and HLN narrow type back plates may be ordered with a jacking screw alignment facility to enable one slide or track to be set exactly parallel to another within a system (see opposite).

- Overall lengths ('L' dimension) should be ordered to correspond with the length of slide or track ensuring that 'C' & 'D' dimensions
- also correspond. Back plate lengths up to 6026mm are available in one piece to suit butted matched sets 45.

 HLN back plates will be supplied with tapped holes and M8 dog point socket set screws to ISO 4028 for customers requiring the jacking screw alignment facility. Hole configuration 'B' denotes jacking screw positions corresponding with fixing hole positions, necessary when used in conjunction with the construction beams (see figure 1). Hole configuration 'A' denotes jacking screw positions mid way between fixing hole positions and is for general use where customers provide their own centre key section or use Hepco alignment dowel pins SDPA as shown in figure 2. Holes for Hepco dowel pins should be reamed to a tolerance K6. Dowel pin head Ø tolerance for engagement with keyway is m6.
- Dimensions G,J,K & M only apply for back plates supplied with either type 'A' or type 'B' hole configurations.
- Type 'B' hole configuration is only available for the HLN25 & HHN25 back plates. Type 'A' hole configurations are available for all narrow type back plates.

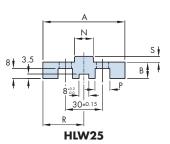

Back Plates

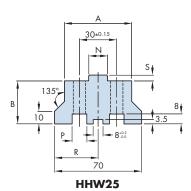

Mounting surfaces and location faces are manufactured to precision extrusion tolerances and are adequate for most applications. Back plates are manufactured from high strength aluminium and are supplied clear anodised. Compatibility of back plates with the various sizes and types of slide, tracks, bearings and lubricators can be found on 446 & 47.

Low Wide Back Plate

High Wide Back Plate

Alignment procedure

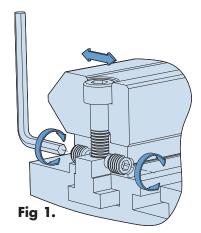

It is normal to use one adjustable slide/ track and back plate element in conjunction with one non-adjustable element. The nonadjustable element should be located onto a key, Hepco dowel pins, or otherwise set adequately straight for the application and bolted down tight.

Where the Hepco construction beams are used, the non-adjustable element should be located by means of Hepco location T-nuts types 'L' and the adjustable element by means of the alignment T-nuts type 'A'. (for T-nut details \$\mathbb{\pi}\$38).

For applications not requiring a construction beam, the adjustable element should be located onto a reduced width key section or Hepco dowel pins type SDPA midway between hole centres. The hole in the mounting surface for fixing, should be spotted and drilled from the back plate to ensure even clearance around the screws.

The adjustable element should be set parallel to the non-adjustable element at the end hole positions with the jacking screws set for even clearance around the fixing screws and the end screws tightened down. Working outwards from the centre of the element and with all but the end screws fully retracted, each jacking screw should be progressively jacked in to influence the elements parallel with the corresponding position on the opposing element then both jacking screws locked and the corresponding fixing screw tightened down. Depending upon available hole clearances, it is possible to bend an element up to 1mm pro-rata per metre.

Alignment principle for use with Hepco beam. Hole configuration 'B' *2

Ordering Example for Back Plates

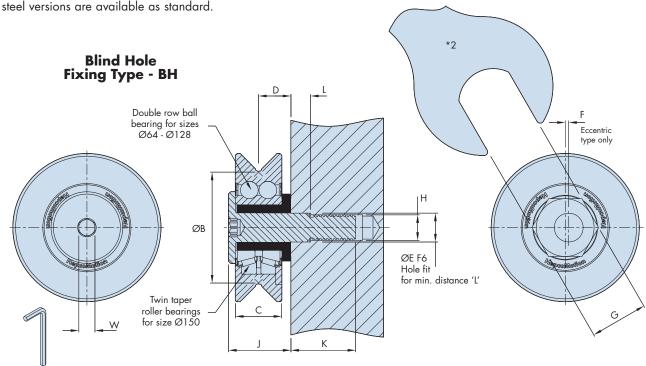

V Bearings

Hepco HJR bearings use double row ball bearings on sizes 64 to 128 and twin taper roller bearings on size 150. These provide high axial and radial load capacity. The design allows for easy assembly, and bearings can be removed from a system with a single screw. Each bearing has a chemically blacked, high tensile steel journal and bush and is available in concentric (adjustable) forms. Each bearing is available with either a blind or through-hole fixing. Stainless

- 1. When using THJR bearings, the part number must be selected to suit the required plate thickness, T. Choose from the tables above.
- Adjustment tools for V bearing and track rollers are available. Please order part number AT54 for HJR64, AT95 for HJR95. AT128 for HJR120/HJR128, and AT150 for HJR150.

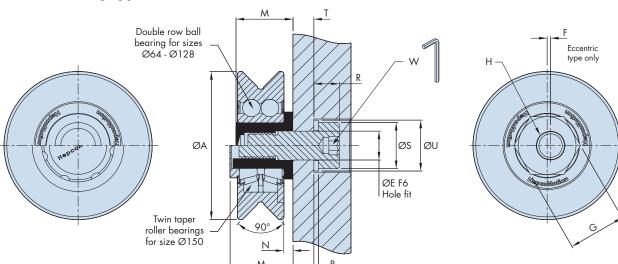

V Bearings

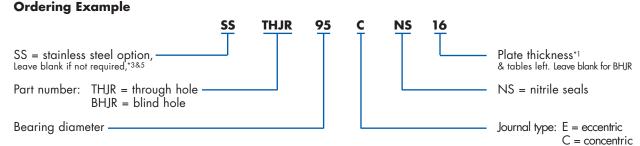

All bearings are greased for life and incorporate nitrile seals to inhibit ingress of liquids and contaminants. Customers are strongly recommended to provide lubrication to the interface between the bearings and the slide by specifying Hepco cap wipers or lubricators which contact the vee of the slide or the bearing. This lubrication greatly increases the load capacity and life.

- Load capacities stated, assume lubrication at the bearing/slide interface. Stainless steel versions have a 25% lower capacity. The quoted static and dynamic load capacities are based on industry standard calculations. These do not accurately reflect performance, and are only provided for comparison with other systems. Please use Max Working Load figures and the load/life calculations on 42-44 to determine system performance. SS versions of the size 150 bearing contains a steel twin taper roller bearing, protected by nitrile seals.

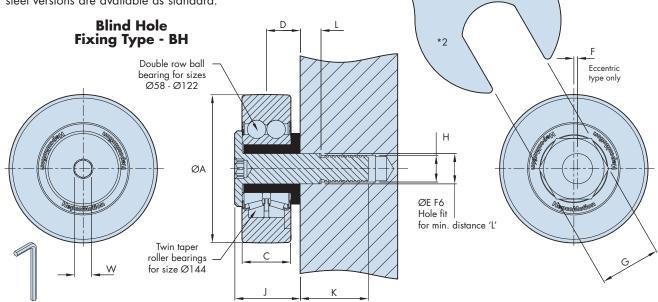

Track Rollers

Hepco HRR track rollers use double row ball bearings on sizes 58 to 122 and twin roller bearing on size 144, these provide high radial load capacity. The design allows for easy assembly, and track rollers can be removed from a system with a single screw. Each track roller has a chemically blacked, high tensile steel journal and bush and is available in concentric and eccentric (adjustable) forms. Each track roller is available with either a blind or though-hole fixing. Stainless steel versions are available as standard.

Part Number	T	*]
Part Number	min	max
THRR 122 17	6.5	1 <i>7</i>
THRR 122 27	16.5	27
THRR 122 37	26.5	37
THRR 144 25	6.5	25
THRR 144 40	21.5	40

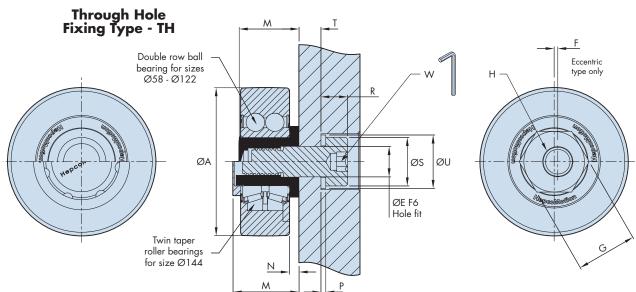

- 1. When using THRR Track rollers, the part number must be selected to suit the required plate thickness, T. Choose from the tables above.
- Adjustment tools for V bearing and track rollers are available. Please order part number AT54 for HRR58, AT95 for HRR89, AT128 for HRR122, and AT150 for HRR144.
- 3. Load capacities stated are for steel bearings, stainless steel versions have a 25% lower capacity.
- 4. With THRN58 a washer is supplied. Fixing screw lengths depend on application and are not included. Use M10 screws in material condition 8.8 or stronger.
- 5. The quoted static and dynamic load capacities are based on industry standard calculations. These do not accurately reflect performance, and are only provided for comparison with other systems. Please use max working load figures and the load/life calculations on \$\mathbb{Q}\$42-44 to determine system performance.
- 6. The narrow track roller is designed to bear on the back face of single edge slides or flat tracks as illustrated opposite. It is specifically intended for use with 25 size V slides and flats tracks in conjunction with either 64 or 95 size bearings and their track roller equivalents. Most other combinations can also be accommodated by using a spacer under the mounting face of either the narrow, or standard wide track roller. Please visit our website www.HepcoMotion.com/hdsdatauk and select datasheet No.3 HDS2 Narrow Track Rollers.
- 7. SS versions of the size 144 track roller contains a steel twin taper roller bearing, protected by nitrile seals.

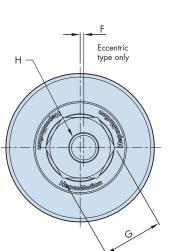

Track Rollers

All track rollers are greased for life and incorporate nitrile seals to inhibit ingress of liquids and contaminants. Customers are strongly recommended to provide lubrication to the interface between the track roller and the flat track by specifying Hepco roller cap wipers or lubricators which contact the surface of the flat track or the track roller.

	М	N	Р	R	øs	ØU	w		Max Working Radial Load		Dynamic (C) Capacities*5

-	80	10	5	33	60	66	22	7.3	80 000	218 000	150 018

Narrow track rollers incorporate a single row ball bearing, and have a different mounting design. Maximum working load capacity is 5kN. They are ideally suited to captivate a system by running on the rear face of a single edge slide or track, see example below.

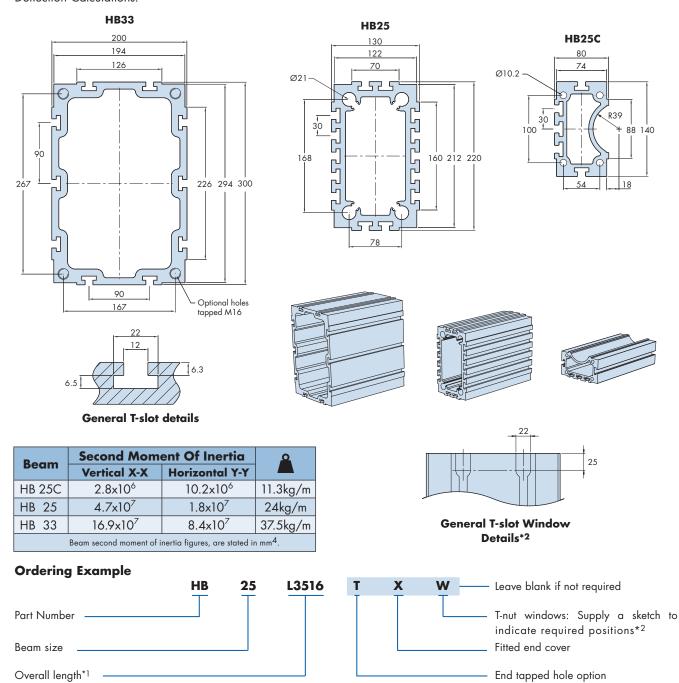

Construction Beams

The design of Hepco construction beams enables slides and flat tracks to be factory assembled directly to the corner faces of the beam or, to be mounted at the many T-slot positions in conjunction with back plates and T-nuts 🕮 24&25. Very high stiffness allows the beams to be used as self supporting construction elements.

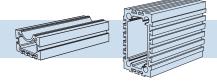

The recess in the HB25C beam has been designed to accommodate a screw drive. Beams are manufactured from high strength aluminium alloy to precision extrusion tolerances and are supplied clear anodised. Beam deflection can be calculated using simple beam theory requiring second moment of inertia figures which are given in the table below. For further details of calculations please visit www.HepcoMotion.com/hdsdatauk and select datasheet No. 2 Beam Deflection Calculations.

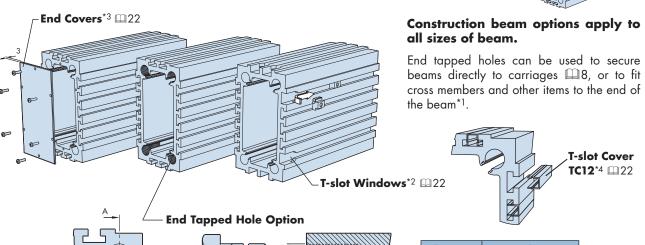

- Beams are cut to customer's length requirements with machine finished ends. They may be requested matched in length and should be ordered minimum 5mm longer than the corresponding slides or tracks. Beams are available in one piece up to 6m long. Special high strength joining systems can be readily supplied to achieve beams of unlimited length. Customers attaching carriage plates or other components directly to the ends of the beam which require a higher than normal squareness are requested to specify this requirement when ordering.

 Where access to beam end will be blocked, customers using high strength T-nuts \$\omega\$38 can specify T-nut windows at either end of
- any T-slot to enable nuts to be inserted. Supply a sketch to indicate required positions.
- Fitted aluminium end covers are supplied clear anodised and are secured via pan head screw DIN7985. Covers are not compatible with end tapped hole option.
- Plastic T-slot cover compatible with all construction beams is available, please specify the number required and length. Example; 14 x TC12 L3000.

- Buffer units are design to fit directly to Hepco construction beams, holes should be drilled and tapped into the beam. Positions are given by dimension L & J, holes should be drilled and tapped M10.

 Dimensions B1 & F1 refer to access for a belt return, available with optional BU...BR
- For use with HB33 beam and carriages fitted with ..HJR150 bearings.

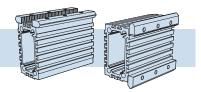

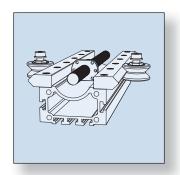

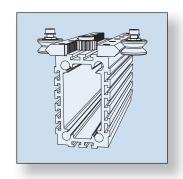

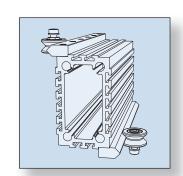

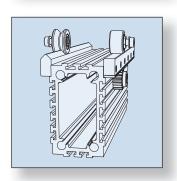

Corner Mounted Slides & Tracks

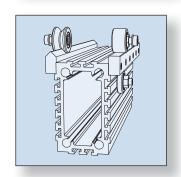

Below are shown a selection of varied ways Hepco single edge V slides and narrow flat tracks can be used when mounted to the corner faces of the construction beams. Slides and tracks should be specified without a keyway. Corner face mounting has the advantage of being lower in cost compared to T-slot mounting due to the back plate and T-nuts not being required. A range of Hepco assembled carriages 26-29 are available to suit all corner mounted slide options. These will be factory adjusted to the beam unit if specified in the ordering details below. Buffer units for end of stroke protection are available 23.

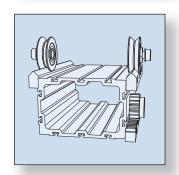

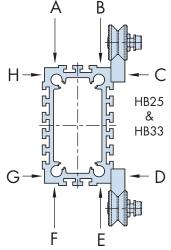

Ordering Example*1&3

Simply list the components required and bracket those to be factory assembled, specifying the mounting positions on the construction beam as relevant. See drawing for construction beam mounting positions. Where slides or tracks are ordered shorter than the length of the beam, it will be assumed that the required position is equidistant from both ends of the beam unless otherwise stated.

Assembled Beams

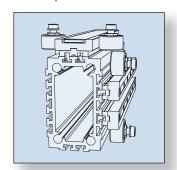

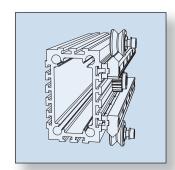

T-Slot Mounted Slides & Tracks

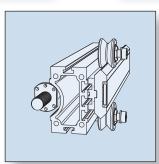

Below is shown a selection of the varied ways Hepco slides and flat tracks can be used when mounted to the T-slot positions of the construction beams. Single edge slides and narrow flat tracks should be specified with a keyway. T-slot mounting has the advantage that one element can be set parallel to another by means of the alignment facility whether they are mounted on the same beam or, on separate beams in parallel 17.

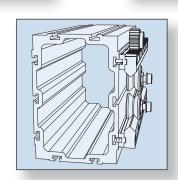

The T-slot mounting method can also accommodate the double edge slides and wide flat tracks (except on HB33 beam). For compatibility of slides and tracks with particular back plates 47.

Notes (See also notes page 22)

- Beams with corner mounted slides and tracks should be ordered factory assembled which ensures best parallelism between linear elements
- 2. Where single edge slides and narrow flat tracks are to be T-slot mounted, please state orientation required ('C' clockwise or 'A' anticlockwise see drawing above) after T-slot position. Example: 1 x CHSS25 L4051 position 4 A.
- 3. But jointed slides and tracks will be fitted for requirements in excess of 4046mm long (hole pitches at the joint may vary \$\mathbb{Q}\$45). Unless specified by the customer, Hepco will determine the individual lengths to make up a matched butted set with the minimum number of joins. Joins will be offset to one another where slides or tracks are mounted in parallel on the same beam. This will ensure best running condition across the joins.
- 4. Cap wipers are not compatible with this option.
- 5. M8 low head cap screws are required when fitting standard double edge slides and flat tracks. Different lengths are available from Hepco for the various configurations 115 for details.

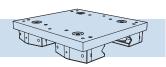

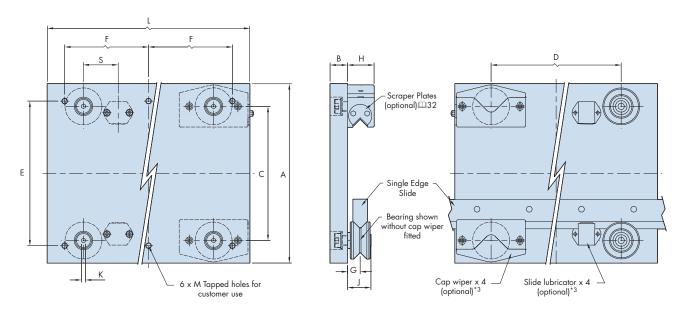

Carriages

Assembled carriages for all sizes of bearing are available to fit all sizes of beam incorporating corner mounted slides. Carriages are also available to fit double edge slides. Carriages are supplied with through hole fixing bearings to facilitate direct removal from the slide. Cap wipers 32 and lubricators 34 are available as options.

Carriage plates are fully machined from high strength aluminium alloy supplied clear anodised with tapped holes provided in convenient positions to enable other components to be attached.

Assembled carriages can be factory adjusted to suit the corresponding beam assembly 224. Special carriages can be readily supplied and material can be removed in unwanted areas to reduce weight.

Rack Driven Carriages

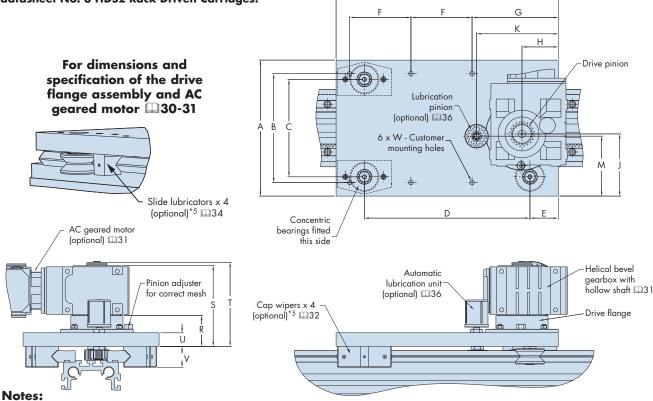

Hepco HDS2 rack driven carriages are available to suit the corner mounted options for construction beam assemblies or for other mounting arrangements with slides spaced the same distance apart 27. They are designed to engage with single edge V slides with integrated racks in precision, stainless steel and commercial grade options. They have all the benefits of the assembled carriages 26-27 with the addition of a high performance rack and pinion drive facility.

Rack driven carriages can be supplied with an automatic lubrication device which will apply a controlled amount of grease direct to the teeth 436.

For installation and adjustment procedure visit www.HepcoMotion.com/hdsdatauk and select datasheet No. 8 HDS2 Rack Driven Carriages.

For Rack Driven Carriage Load Capacities 42

- Module 2.5 and 4 helical racks have a left handed helix angle of 30°, available as a standard option on HSS25HR and HSS33HR slides respectively.
- 2. Assembled carriáge weights do not include motor & gearbox, 🕮 31 for details.
- 3. Motor mounting position 3,4,5 & 8 are not compatible with the standard mounting position of the automatic lubrication unit, alternative positions of the lubrication unit are available.
- 4. SS versions have all stainless steel components except carriage and drive flange body which are aluminium clear anodised (enhanced anti-corrosion finish available on application). Cap wipers are plastic, geared motor is standard.
- 5. For cap wiper mounting hole positions @32. For lubricator mounting hole positions @26 & 34.

Rack Driven Carriages

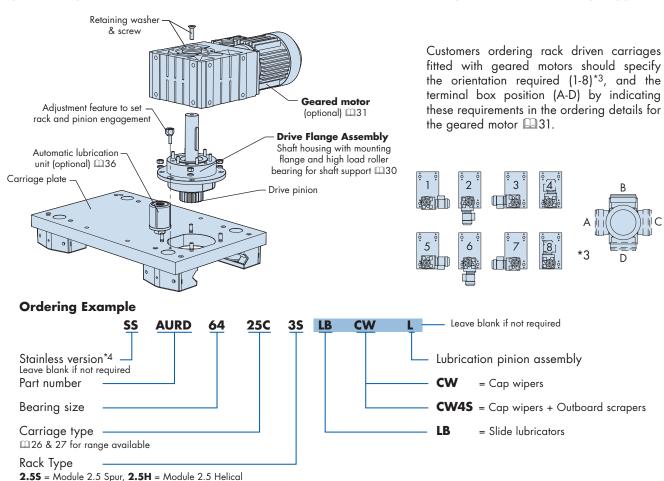

Rack driven carriages incorporate a strong drive flange assembly with micro adjustment facility to achieve correct mesh between pinion and rack \$\omega\$30. The standard design is for connection with Hepco supplied AC geared motors \$\omega\$31 this being the most economical means of achieving point to point linear motion. Speed and acceleration can also be controlled via an AC speed controller which Hepco also supplies.

Modified or special drive flanges can be readily supplied to suit customers own motor gearbox, including servo and stepper types.

Special shape and size carriages, and carriages to suit different slide spacing, can be readily supplied.

35 = Module 3 Spur, 4H = Module 4 Helical, 55 = Module 5 Spur

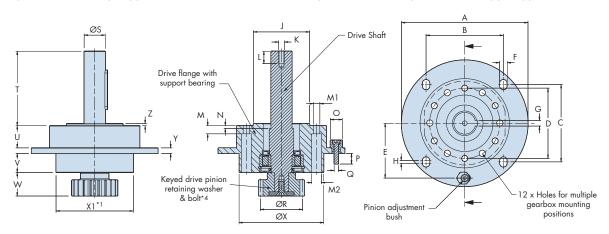

Drive Flange Assembly

Hepco drive flange assemblies are available to suit all five rack sizes*6. They are designed to mount on the top face of the rack driven carriage and connect the drive from the geared motor, to the pinion. A high capacity roller bearing is fitted to provide rigid support to both geared motor and carriage, and to withstand high radial loads*3. Axial forces which are generated when helical rack and pinion are used, are supported by the gearbox bearings. The drive flange assembly features a unique micro adjustment facility for achieving correct mesh between pinion and rack.

The drive flange body for both stainless (SS) and standard versions is in aluminium clear anodised. An enhanced anticorrosion finish is available on application. The stainless version is supplied with stainless steel shaft, pinion and fixings, and steel roller bearing protected by nitrile seals. Pinions mod. 2.5 and 3 are keyed to the shaft and retained by screw and washer. The larger pinions mod. 4 and 5 incorporate a keyless locking bush for secure fixing under higher loading conditions 435. Stainless pinions are supplied keyed to the shaft and retained by screw and washer. Other sizes of pinion can be readily supplied to special order*5.

The standard drive flange assembly as shown, is designed to be coupled with Hepco geared motors but modified or special drive flanges can be readily supplied to suit customers own motor gearbox, including servo and stepper types.

Ordering Example	SS	HDF	<u>305</u>	20	
Stainless version*6 Leave blank if not required					Number of teeth of pinion
Part Number					Rack and pinion Module/type

- X1 denotes the dimension between the parallel faces of the flange body which engages with the slot on the carriage for adjustment purposes.
- Rack and pinion module: S = spur, H = helical.
- 3.
- Drive flange assemblies have a dynamic radial bearing capacity (C_R) of 38000N for HDF25&30, and 60500N for HDF40&50. Drive flange assembly shown in the drawing is for module 2.5, 3 & SS versions, module 4 & 5 use a keyless locking bush \square 35. 4.
- Customers requiring alterative pinion sizes should note that the mounting position of the drive flange assembly on the rack driven carriage 28-29 will need to be altered to compensate. Please discuss this requirement with Hepco.
- Stainless version (SS): drive flange assemblies are available to suit spur racks only.

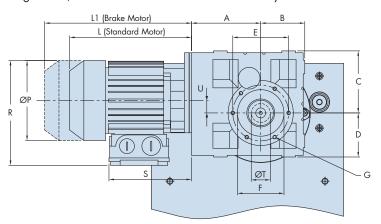

AC geared motors

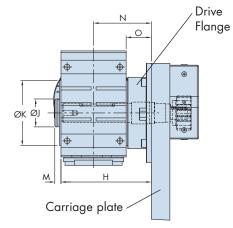

Hepco rack driven carriages can be supplied with an AC geared motor which provides a simple and low cost means of achieving point to point linear motion. Helical bevel gearboxes with hollow output shafts are supplied as standard. The compact design complements the Hepco rack driven carriage and the hollow shaft allows direct connection of the drive flange assembly with maximum rigidity.

3 phase motors are available with, 2 or 4 poles, (running at approximately 2800 & 1400rpm, respectively, and comply with IEC34-VDE530, DIN57530 and 42677). Motors are protected to IP55, and are finished in silver grey paint. Motors with alternative single and three phase windings, special finishes and enhanced IP protection rating are available on request. The large range of motor sizes and gearbox ratios available, enable ideal solutions to be specified for most applications. For requirements outside AC motor capabilities, servo motors can be directly fitted to the helical gearbox via a standard or tailored input flange.

In all cases customers are requested to discuss their requirements with Hepco who use special selection software to quickly specify the correct choice of motor and gearbox. Dimensions stated below could vary depending on the choice of motor and gearbox, and are shown for initial selection only.

Ordering Example

Notes:

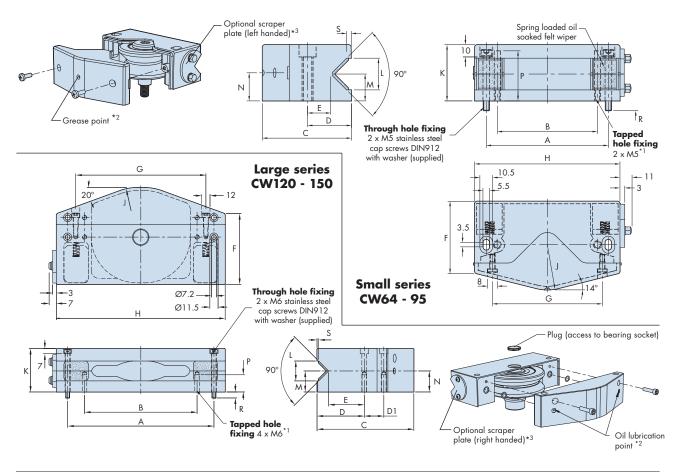

1. 'T' dimension refers to hollow shaft diameter for the gearbox, this can be cross referenced to 'S' dimension on \$\subseteq 30\$ to aid selection of the drive flange assembly.

Bearing Cap Wipers

Cap wipers encapsulate the bearing when engaged with the slide and provide constant lubrication to the contact faces thereby greatly increasing load capacity and life. They prevent ingress of debris and improve safety and appearance. Lubrication is by means of sprung loaded oil impregnated felt wipers. The small series has a central cavity filled with grease which partially liquifies under operation and recharges the wipers.

The large series incorporates high lubricant capacity felt wipers which can be recharged with oil as required. Cap wipers are made from impact resistant plastic and have a removable section to allow access to adjust the bearing. Two methods of attachment are provided, either from above or from below. Fixing positions should be calculated from the V apex of the slide using dimensions E and D1 as relevant. Alternatively see 41.

Bearing Ø				RS = Right handed scraper Leave blank if not required

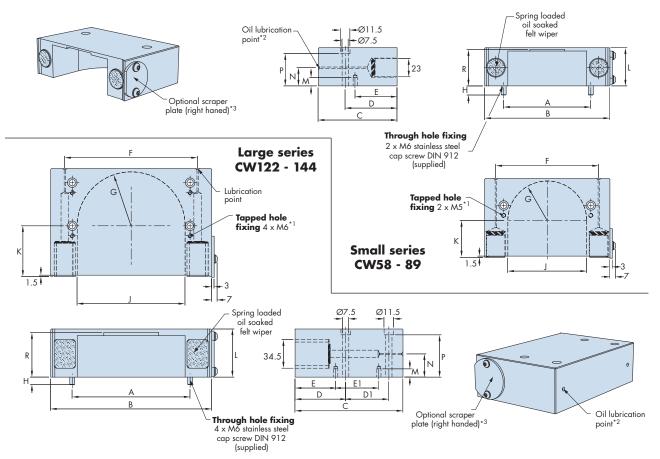

- 1. **Tapped hole fixing for small series:** Inserts provide M5 x 9mm thread. A deep cavity behind accommodates long screws (ref. P dimension). Mounting plates should be drilled Ø7mm for adjustment purposes. **Tapped hole fixing for large series:** Tapped holes M6 x 17 deep are provided. Mounting plate should be drilled Ø7mm for adjustment purposes.
- 2. Lubrication intervals depends on stroke, duty and environmental factors 49 for lubricants. Threaded inserts can be incorporated in a number of positions to enable cap wipers to be linked to a central lubrication point or lubrication capitals.
- 3. Optional scrapers in hardened stainless steel are adjustable for maximum exclusion of debris in harsh environments. It is normal to specify scrapers only for the outermost ends of the cap wipers within a system.

Roller Cap Wipers

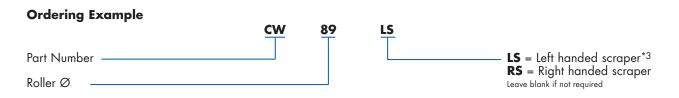

Roller cap wipers encapsulate the track roller when engaged with the flat track and provide constant lubrication to the contact faces thereby increasing the life of the system. They inhibit ingress of debris and improve safety and appearance. Lubricant is applied to the surface of the track by means of sprung loaded oil impregnated felt wipers. Roller cap wipers are made from impact resistant plastic and are easily removed from the system to give access for adjustment of the track rollers. Two methods of attachment are provided, either from above or from below.

Fixing positions should be calculated from the contact face of the flat track using dimensions E/E1 and D/D1 as relevant. Alternatively see 41.

- For adjustment purposes, the holes in the mounting plate for the tapped hole fixing method should be drilled Ø7mm for the small series roller cap wiper and Ø8mm for the large series.
- 2. Lubrication intervals depends on stroke, duty and environment 49 for lubricants. Threaded inserts can be incorporated at a number of positions to enable roller cap wipers to be linked to a central lubrication point or lubrication canister 37.
- Optional scrapers in hardened stainless steel are adjustable for maximum exclusion of debris in harsh environments. It is normal to specify scrapers only for the outermost ends of the roller cap wipers within a system.

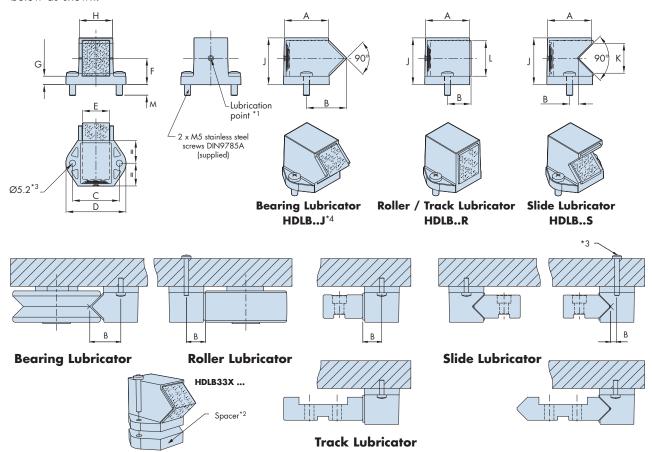

Lubricators

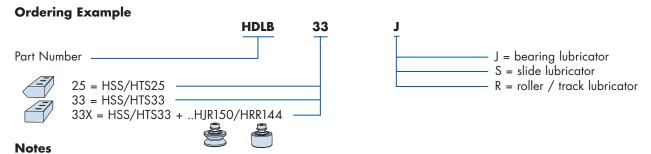

Lubricators provide a simple and versatile means of applying lubricant to a system thereby increasing load capacity and extending life. Lubricators consist of an impact resistant plastic housing incorporating a sprung loaded oil impregnated felt wiper. There are three types available for applying lubricant directly to either slide, flat track and track roller or V bearing. They can be sited in any convenient position to give best access for re-lubrication and can be mounted from above or below as shown.

For compatibility with mating components 46-47

- The lubrication interval depends on stroke, duty and environment 🕮 49 for lubricants. Threaded insert can be incorporated at the lubrication position to enable lubricators to be linked to a central point or lubrication canister 🕮 37.
- HDLB33X lubricators will be supplied with a spacer to match the height of the Ø150 bearing and Ø144 track roller. For through hole fixing, the Ø5.2 holes in the lubricator should be tapped M6.
- The use of bearing lubricators allows easy carriage disengagement with the slide, as only the bearing will need to be removed.

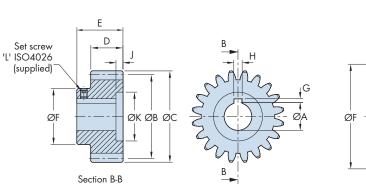

Pinions

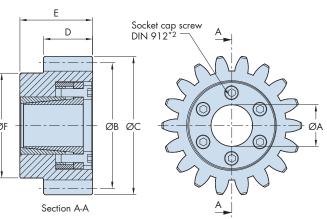

Pinions are made from high grade case hardened steel, the teeth are precision ground to ISO 1328 grade 6 for maximum wear resistance. Two types of pinions are available to suit the spur and helical rack cut into the back face of the single edge V slide and flat track. The smaller module pinions are supplied with a keyway location to mate with the drive shaft. The large module 4 and 5 pinions incorporate a locking bush which, when tightened, locks onto the shaft and makes a rigid connection. Stainless steel spur pinions are available as standard and are supplied with a keyway location only.

Ordering Example

- 1. Module 2.5 & 3, and all stainless steel pinions are supplied with location keyway and both retaining washer and a countersunk screw. All other steel versions are supplied complete with a locking bush.
- 2. Locking bush retaining bolts should be tightened to a torque of 17Nm.
- 3. All steel pinions are supplied case hardened with ground teeth as standard, stainless steel versions are manufactured from 420 stainless steel and are hardened and ground.

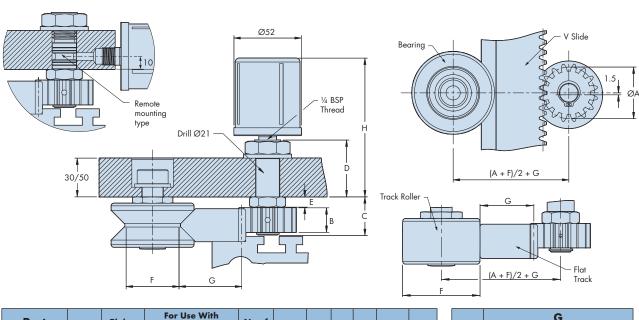

Automatic Rack Lubrication

Hepco automatic rack lubrication systems provide constant lubrication to the rack and pinion interface. Two types are available, integral canister mounting, and remote canister mounting which require lubricant passageways in the carriage plate to be drilled as required. The lubrication systems are available to suit all sizes of rack driven carriage 28-29 and are generally suitable for customers own manufactured carriages of the required thickness.

They are compatible with most combinations of Hepco rack elements and bearings, either V slides with V bearings or flat tracks with rollers. These combinations are given in the table below. Lubrication is carried out by means of grease filled pressure canister which delivers lubricant at a controlled rate via cross drilled plastic pinion direct to the teeth of the rack. The eccentric mounting journal allows correct engagement of the lubrication pinion with the rack.

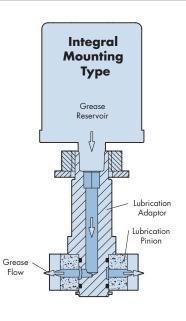

Rack lubrication units to suit other thickness of carriage plate can be readily supplied to special order.

Automatic Rack
Lubrication unit
Rack module / Type

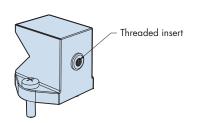

Rack lubrication canisters should be ordered separately Part Number LAGD125

Lubrication Accessories

Hepco can provide modifications to the standard cap wipers and lubricators so that they can be easily connected to a centralised lubrication system. By adding threaded inserts to locations on the lubricator and cap wiper body it allows threaded connectors to be fitted so that oil lubrication can be fed directly to the felt wipers. Inserts with M4, M5 and M6 threads are available as standard options, other sizes are available on request.

Lubricator Options

All types and sizes of lubricator as detailed on \$\mathbb{\begin{align*}} 34 can be fitted with threaded insert at the lubrication point, please refer to that page for positions. Standard fitted inserts may be ordered by adding a suffix as shown below, to the lubricator part number 434.

Ordering Example

State Lubricator part number \$\Pi34\$ followed by:

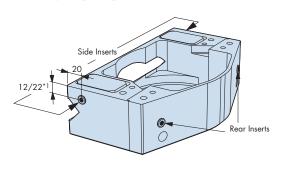

C4 for M4 insert. C5 for M5 insert. C6 for M6 insert.

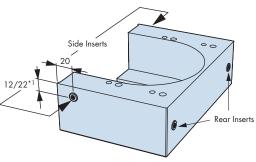

All types and sizes of bearing cap wipers and roller cap wipers as detailed on 🕮 32 & 33 can be fitted with threaded inserts. Inserts may be fitted either one or both ends of the wiper body or, at one or both oil lubrication positions in the back face 🕮 32 & 33. The small series cap wipers are available only with inserts fitted at the ends*2.

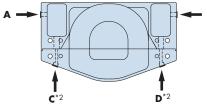

Oil lubrication into the felt wiper one end of the wiper body is generally sufficient to ensure carry over of lubricant to the felt insert in the other side of the body (see automatic lubrication example at the bottom of the page). This allows an outboard scraper to be fitted at the opposite end to the insert if required.

Bearing Cap Wiper Insert Positions

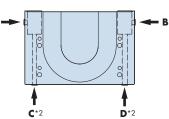

Ordering Example

State Bearing Cap Wiper / Roller Cap Wiper part number \$\Pi 32 \& 33\$ followed by:

 Choose insert position A - D C4 for M4 insert. C5 for M5 insert.

C6 for M6 insert

Notes:

- Roller cap wipers CW144 and bearing cap wiper CW150 have insert dimension 22mm from the wiper mounting base. All others have a dimension of 12mm.
- 2. Insert positions C & D are not available for small series bearing cap wipers CW64 & CW95.

For further information visit www.HepcoMotion.com/ hdsdatauk and select datasheet No. 9 HDS2 Cap Wiper Options.

Automatic Lubrication For Cap Wipers

Threaded inserts for cap wipers and lubricators enable them to be linked to a central lubrication point or pressure feed canister. Hepco are able to supply carriages with linked lubrication devices according to customers preferred layout. The illustration shows one of the many possibilities.

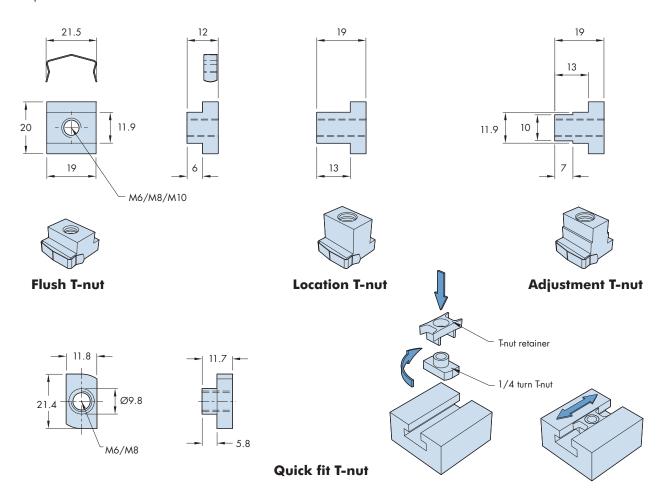

Hepco T-nuts are manufactured in high grade steel supplied chemically blacked and are designed to fit the T-slots of the Hepco construction beams. Three types of high strength T-nut are available, the flush type HTNM for attachment of customers own components, the location type HTNM8L which locates into the keyways of the Hepco back plates 16-17, and the adjustment type HTNM8A required for system alignment facility 17. All high strength T-nuts are supplied with a retaining spring clip to prevent loss of position, when the T-nut is fitted into the T-slot in the construction beams.

Also available is a range of quick fit T-nuts. These can be inserted directly into the T-slot of the construction beams and rotated through 90° to engage. Available with threads of M6 and M8, the quick fit T-nut is supplied with a plastic retainer to prevent the T-nut from turning when the fixing bolt is loosened. It also holds the T-nut in place and allows repositioning if required.

Pa Num		Туре	Thread	Retainer
HTN	M6	Flush	M6	Spring
HTN	M8	Flush	M8	Spring
HTN	M10	Flush	M10	Spring
HTN	M8L	Location	M8	Spring
HTN	M8A	Adjustment	M8	Spring
HRTN	M6	Quick fit	M6	Plastic
HRTN	M8	Quick fit	M8	Plastic

Ordering Example

Simply state the quantity and the part number of the type of T-nut required.

Example: 10 x HTN M10 10 off Flush type T-nut with M10 thread and spring retainer.

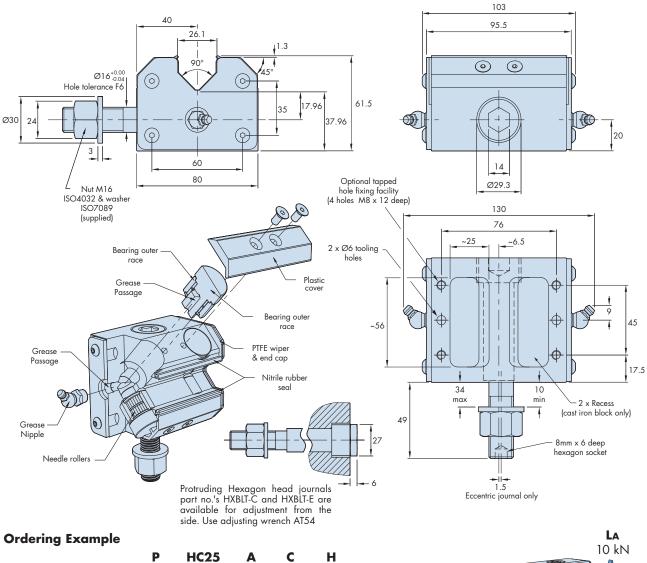

Bearing Blocks

Bearing blocks feature high capacity full complement needle roller races within a precision machined rigid casting. A lubrication facility channels lubricant direct to the needle races then onto the roller/slide contact faces. Side and adjustable end seals retain the lubricant and prevent ingress of debris. Bearing blocks can be mounted via high tensile steel concentric and eccentric (adjustable) journals or, by using the optional tapped hole facility in the back face. Blocks are available in high quality nodular cast iron, high strength aluminium, and stainless steel to a slightly different design.

For load capacity, technical specification and further details including stainless steel version, please visit our website www.HepcoMotion.com/hdsdatauk and select datasheet No.4 HDS2 Bearing Blocks.

IMPORTANT: Lubrication channels are not interconnected. Both ends must be charged with grease*1.

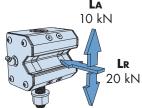

Block version
P = to suit precision slides,
C = to suit commercial slides
Part Number

Tapped hole fixing facility
(No journal supplied)

Journal type
E = eccentric, C = concentric

Block material A = Aluminium, S = Cast Iron, SS = Stainless steel*2

Cast Iron block = 3 kg, Aluminium block = 1.2 kg, and journal = 0.4 kg.

- 1. On installation, blocks should be charged with NLGI No 2 lithium soap based grease. Lubrication intervals will vary between applications, but once per 200km would be typical.
- Stainless steel block are only available in 'P' grade to suit precision slides.

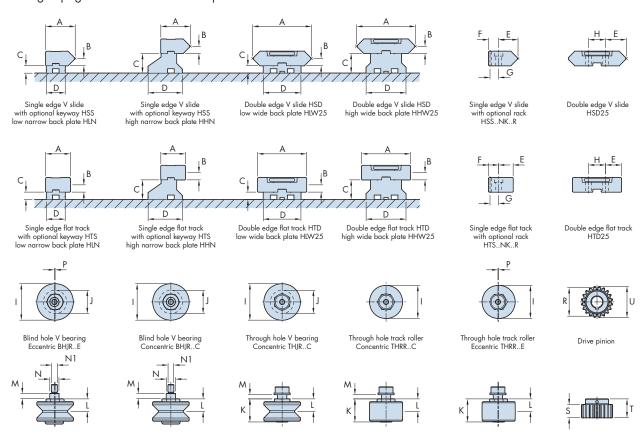

Data and Dimensions for Assembled Systems

Use this section to calculate the overall dimensions of a system without having to refer to dimensions on individual component pages. Use it also for calculating drilling positions and for important reference dimensions of mating components. These tables include all basic dimensions for most standard components. For more detailed dimensional information refer to the catalogue pages for the individual components.

- The calculated position of the pinion relative to the rack gives an approximate location only. Customers should make provision for the pinion to be adjusted relative to the rack to ensure the best running condition. The Hepco drive flange assembly 🕮 30 includes a facility for this type of adjustment.
- Mounting hole for bearing (ref. N dimension) should be drilled and reamed tolerance F6.
- P dimension refers to eccentric V bearings and track rollers only.

Load Life Calculations

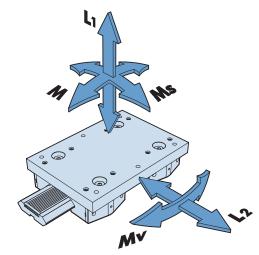

The load capacity and life expectancy of Hepco HDS2 will be determined by several factors. The key factors are the size and type of bearings and slide, the presence or absence of lubrication and the magnitude and direction of loads. Other factors including operational speed, length of stroke and environmental conditions may also have an effect.

When calculating the system load and life, one of two approaches should be taken: if the system uses a conventional 4 bearing carriage (such as any of the Hepco HDS2 carriages), then this may be treated as a single item, and the load and life be determined as in the **Systems with carriages** section below; alternatively, each bearing can be treated separately according to the method shown in the **Individual bearing calculations** section.

Systems with Carriages

When calculating the loading and life of a V slide system using a 4 bearing carriage, the loading on the system should be resolved into the direct load components, L1 and L2, and the moment loading components M, Mv and Ms (see diagram on the right).

The maximum direct and moment load capacities for HDS2 carriages are given in the tables below. Capacities are included for both 'dry' and 'lubricated' conditions - this refers to the 'V' contact, since all bearings are greased internally for life. Values are based on shock free duty.

Load capacities apply to steel systems, for stainless steel systems load capacities are 25% lower

Calculating the System Load Factor

To calculate the system life, the load factor LF should first be calculated using the equation below. Where Mv and M loads are concerned, the $Mv_{(max)}$ and $M_{(max)}$ for the relevant carriage will need to be determined. This is established by multiplying the figure shown in the table by the spacing of the bearing, D, in millimetres. LF should not exceed 1 for any combination of loads. Once LF has been determined for the application, the life is calculated as shown on 43.

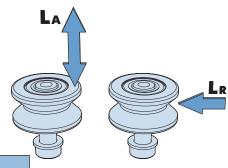

$$Load\ Factor\ LF = \ \frac{L_1}{L_{1(max)}} + \frac{L_2}{L_{2(max)}} + \frac{Ms}{Ms_{(max)}} + \frac{Mv}{Mv_{(max)}} + \frac{M}{M_{(max)}}$$

Load Life Calculations

Individual 'V' Bearing Calculations

Many systems do not use standard carriages. In such cases it is necessary to use conventional statics calculations to determine the loading on each bearing in the system, by resolving into axial LA and radial LR components. Maximum capacities for all types of Hepco HDS2 'V' bearings are given in the table below, and are included for both 'dry' and 'lubricated' conditions - this refers to the 'V' contact, since all bearings are greased internally for life. Values are based on shock-free duty.

Bearing		Dry		Lubricated					
Part	La (max)	La (max) LR (max)		La (max)	LR (max)	Basic Life			
Number	N	N	(km)	N	N	(km)			
HJR64	2500	8000	300	2500	8000	500			
HJR95	7000	20 000	400	7000	20 000	400			
HJR120	-	-	-	10 000	30 000	700			
HJR128	10 000	30 000	500	10 000	30 000	700			
HJR150	-	-	-	17 000	50 000	2000			

The above figures assume that bearings are used with slides equal or larger than the preferred slide selection for that bearing size. For details of the preferred sizes, 18-19. For loading of bearings with smaller slides, please contact Hepco.

Calculating the System Load Factor

To calculate the system life, the load factor LF should first be calculated using the equation below.

$$Load \ Factor \ LF = \frac{LA}{LA_{(max)}} + \frac{LR}{LR_{(max)}}$$

LF should not exceed 1 for any combination of loads.

Once LF has been determined for each bearing, the life can be calculated as follows:

Calculating System Life

With the LF determined for either a 4 bearing carriage or for an individual bearing, the life in km can be calculated using one of the three equations below. In these equations, the Basic Life is taken from the table (above) in respect of the bearing and lubrication condition applicable.

Dry System

Lubricated System

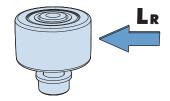

Life (km) =
$$\frac{\text{Basic Life}}{(0.04 + 0.96 \text{LF})^2}$$
 Life (km) = $\frac{\text{Basic Life}}{(0.04 + 0.96 \text{LF})^3}$ Life (km) = $\frac{\text{Basic Life}}{(0.04 + 0.96 \text{LF})^{3.3}}$ (Use this calculation for all bearings other than ...HJR150.) bearings only.)

For further information regarding calculations using the methods above visit <u>www.HepcoMotion.com/hdsdatauk</u> and select datasheet No. 5 HDS2 Load Life Calculations.

- 1. The maximum values of L1, L2, Ms, M, Mv, LA and LR, and the magnitude of the system basic life for each bearing type, relate to the performance of complete systems. Tests have shown these figures to be more reliable than working from theoretical static and dynamic load capacities (C and Co) of the bearings.
- 2. The calculations within this section assume that the linear stroke involves a number of complete bearing revolutions. If the stroke of any application is less than five times the bearing outside diameter, then please calculate the distance travelled as if it moves five bearing diameters per stroke. Systems operating at speed in excess of 8m/s may require additional calculations. Please contact Hepco for assistance.
- 3. For the purpose of the Load/Life calculations on this page, the axial load LA is the load in the axial direction which the bearing can accept from a 'V' slide engaged in its outer ring. Since the line of force is some distance removed from the axis of the bearing, this value is much less than the theoretical axial load capacity of the bearing.
- 4. In the above calculations, the term lubricated refers to the contact between the slide and bearing 'V's. This lubrication may best be achieved using Hepco lubricators, cap wipers, however other methods which ensure the presence of a suitable grease or oil in the critical area are acceptable.
- 5. When a system consists of more than 4 bearings per carriage (e.g. see application example on (19) it cannot always be guaranteed that the load will share equally between all bearings. In such cases it is recommended that the system be derated to allow for the life of the most heavily laden bearing. Please contact Hepco for assistance.

Track Roller Calculations

Systems incorporating track rollers running on flat tracks or flat faces of the single edge 'V' slides will require a different calculation to determine the load and life. Track rollers only have a radial load capacity stated as they are not usually loaded axially. Their pure rolling contact with the track means that they do not need to be derated for use in unlubricated applications (although it is recommended that the tracks and rollers be lightly oiled for best performance).

The maximum radial load capacity LR for the Hepco HDS2 track Roller is stated in the table below.

Load Capacities				
Roller Part	LR (max)	Basic Life (km)		
Number	N			
HRN58	5 000	500		
HRR58	10 000	300		
HRR89	20 000	400		
HRR122	30 000	700		
HRR144	80 000	500		

Calculating the System Load Factor

To calculate the roller life, the load factor LF should first be calculated using the equation below.

Load Factor LF =
$$\frac{L_R}{L_{R_{(max)}}}$$
 LF should not exceed 1.

Calculating Track Roller Life

With LF determined for each roller, the life in km can be calculated using the equation below. The basic life is taken from the table (above) for the respective track roller.

Rack and Pinion Force Calculations

The driving force which can be transmitted through a rack and pinion will depend on the choice of rack (e.g. Mod 2.5 spur or Mod $4 \times 30^{\circ}$ helical), the size of pinion selected, the length of stroke and the desired life (total travel in km). The table below details the driving force in N for all combinations of parts and for a useful range of stroke lengths and design lives. All figures assume ideal lubrication and pinion contact conditions, and that all movement is for the full stroke indicated. It is recommended that a safety factor be applied when selecting rack and pinion components. This table is suitable for initial selection of parts, but please contact Hepco if you require a specific calculation tailored for your application.

Rack and Pinion	Stro	ke length =	: 1m	Stro	ke length =	: 4m	Stroke length = 16m			
combination	Expected	life of rack	& pinion	Expected	life of rack	& pinion	Expected life of rack & pinion			
Combination	1000km	5000km	25000km	1000km	5000km	25000km	1000km	5000km	25000km	
Mod 2.5 & 20 tooth pinion	2200	1700	1200	3700	2500	1800	3700	3600	2500	
Mod 2.5 helical & 20 tooth pinion	3300	3000	2500	4300	3500	3100	4300	4100	3500	
Mod 3 & 20 tooth pinion	3400	3100	2500	4400	3600	3200	4400	4300	3600	
Mod 4 helical & 20 tooth pinion	6700	5200	3700	11800	8000	5800	11900	11000	8200

Mod 5 & 24 tooth pinion	5800	4700	3300	10900	7400	5300	11000	11000	7500	

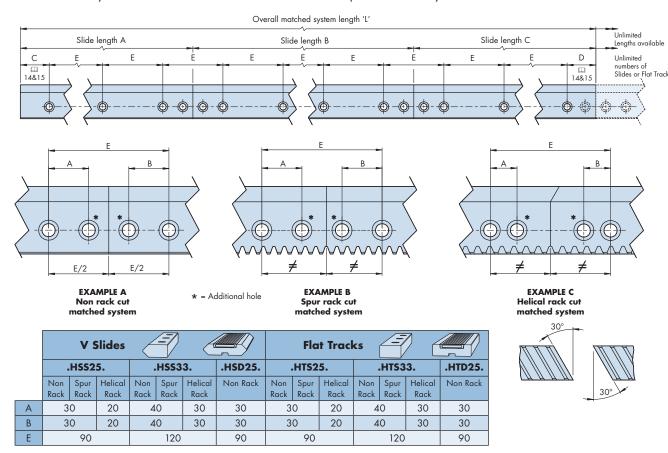

Matched Systems

Slides or flat tracks can be ordered as matched sets to achieve any length. This is useful not only for achieving very long lengths but also for multiple short lengths to enable replacement of a damaged section.

For standard matched system requirements, Hepco will supply a number of slides or flat track lengths to achieve the overall length required with the minimum number of joins. A continuous hole pitch will be maintained along the entire length of the matched system and an additional hole will be provided either side of the joint for security and alignment. For plain, non rack cut matched systems, the joins will be central between mounting holes (see example A). For rack cut systems, the join position between teeth may not coincide with the centre position between holes and therefore could be up to one tooth pitch offset either side (see examples B & C).

Where specific rack cut lengths or multiple identical rack cut lengths are required, these must be ordered to a factor of the tooth pitch. Special hole positions may be required.

In all matched systems the details are recorded to enable the replacement of any individual slide or track.

For best running quality when using single edge slides or flat tracks in parallel, it is advisable to offset the joints so they do not coincide. It is also important to ensure that slides and tracks overlap any joints in the back plates or beams where these have been supplied in joined condition for long length requirements. Such applications should be discussed with Hepco.

For further information on matched systems and installation details, please refer to www.HepcoMotion.com/hdsdatauk and select datasheet No. 6 HDS2 Matched Systems. IMPORTANT: All matched system requirements should be referred to Hepco's Technical Department.

Ordering Details

Standard matched systems (longer than 4046mm):

Simply state 'L' to the required overall length according to the slide and flat track ordering details 🕮 15.

Specific or identical length matched systems:

State the overall length of the matched slide or track required and the individual quantity and lengths of which it is comprised, according to ordering details 15.

Example 1: 1 x matched P HSS25 L7826 NK R C43 D43 comprising 4 x P HSS25 L1956.5 NK R

Note: For rack cut slides and tracks, Hepco will determine the C & D dimensions to suit the rack pitch across the joins.

Example 2: 1 x matched P HSS25 L5576 C43 D43 comprising;

1 x P HSS25 L3688 C43 D45 + 1 x P HSS25 L1888 C45 D43

- Track rollers, roller cap wipers and roller lubricators are compatible with single edge V slides, when used on the back face of the slide. Double edge V slides & flat tracks can only be fitted to the Hepco construction beams by using the HLW25 or HHW25 back plate and T-nuts $\square 25$.
- Allowances for differences in mounting heights will be required, please refer to the relevant component pages for details.

- Track rollers, roller cap wipers and roller lubricators are only compatible with single edge V slides, when used on the back face of the slide. Roller cap wiper CW122 is only compatible with HTS25 + HHN25 and HTS33 + HHN33 when running on the front face of the flat track.
- Roller cap wiper CW144 is only compatible with HTS33 + HHN33 when running on the front face of the flat track.

Installation

This page covers general installation of V bearings and track roller systems. Further installation details can be found on our website www.HepcoMotion.com/hdsdatauk by selecting datasheet No. 7 HDS2 Fixing of Slides and Bearing Elements. For installation details of bearing block systems (insert image) please select datasheet No. 4 HDS2 Bearing Blocks.

V Slides and Flat Tracks (Without Hepco Back Plates)

For optimum performance and accuracy, slides and tracks should be mounted on a flat surface. Single edge V slides and single edge flat tracks should be set parallel in a system either by clamping the back faces against parallel registers, or by locating the keyways onto Hepco dowel pins or purpose made key sections. Double edge V slides and wide flat tracks may be located in a similar manner utilising the keyway if precise straightness or positional location is required.

V Slides and Flat Tracks (With Hepco Back Plates)

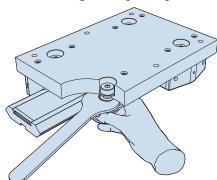

Installation of slides or tracks mounted on back plates is similar to the above procedure. Either the edge of the back plate itself or the keyway can be utilised to provide a datum reference. If the edge of the back plate is used, it is important to ensure that the depth of register affords running clearance for the V bearings, cap wipers and bearing blocks. It is advisable to set the assembled elements against the loaded side of the keys/dowels in order to overcome any slight clearances.

Customers mounting single edge V slides or single edge flat tracks in parallel are recommended to specify the jacking screw alignment facility available for use both with and without the Hepco construction beam (\square 17 for installation details). Customers may also specify the location T-nut HTNM8L for locating assembled elements to construction beams. N.B. Location T-nuts should be used in only one or other of the two large keyways in the wide plate HLW25.

Drilling (V slides and Flat Tracks)

It is recommended that holes in the mounting surface should be drilled using the slide or track as a template, unless an accurate means of pre-drilling is available.

V Bearings/Cap Wipers and Track Rollers (See figure below left)

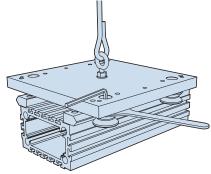

The mounting surfaces for the V bearings should be flat and in the same plane. The bearing elements should be assembled to the mounting surface or carriage with the concentric bearings on the side taking the greatest load. In the case of more than two bearing assemblies engaged on the datum (concentric) side of the slide or track, all bearing assemblies in between the two outermost concentric assemblies should be eccentric type to allow precise engagement and sharing of the load. All bearings on the opposite side should be the eccentric type.

The concentric bearings should be fully tightened and the eccentrics semi-tightened then adjusted to their outermost position. The complete carriage assembly minus any additional components should be counterbalanced through its centre of gravity by means of a length of rope. N.B. It is recommended that a lifting eye in the appropriate position be provided for this purpose.

With the carriage in its counterbalanced condition the eccentric bearings opposite the concentrics should be rotated using the Hepco adjusting wrench until engaged with the slide or track such that there is no detectable play and minimal preload. The bearings should be checked for preload by rotating between forefinger and thumb such that the bearing skids against the slide or track without application of undue force. The adjusted bearings should then be fully tightened and checked again for preload. The process as described should be repeated for any pairs of eccentric bearings fitted in between the outermost ones. The carriage assembly may then be checked for free running by pushing back and forth along the slide.

The carriage should be withdrawn from the slide to enable bearing cap wipers to be fitted if required. (Roller cap wipers can be fitted without the necessity to withdraw the carriage.) The carriage should be returned to the slide with cap wipers adjusted to achieve maximum compression of the felt wipers without the slide contacting the

plastic body. The carriage assembly should then be checked for running quality in the non-counterbalanced condition. On completion of adjustment, the chamber of the small series bearing cap wipers only, should be charged with grease 49.

Important: Additional preload imposed on the system by incorrect adjustment or misalignment will reduce the load capacity and life of the system. Customers are advised to make allowances for this.

Bearing Adjustment and Carriage Removal

Bearing adjustment can take place with cap wipers in place and without the need to remove the carriage from the slide or track. First remove the front cover from the cap wiper body to expose the eccentric bearings, this will allow access for the adjustment wrench. Adjustment for the bearings themselves is as described above, again adjustment should take place with the carriage in its counterbalanced state.

Carriage removal can take place without the need to slide the carriage to the end of the slide or track. Remove the front covers from the cap wipers covering the concentric bearings, this will allow access for the adjustment wrench. With the wrench in place, unscrew the bearing stud from the bearing, once removed the bearing can be removed from the carriage. Remove the cap wiper body and the carriage can now be lifted clear from the slide. Replacement is the reversal of this procedure, the advantage of this method is that the eccentric bearings are not affected therefore adjustment should not be required.

Technical Specifications

'V' Slides & Flat Tracks

Material and finish: High carbon bearing steel, hardened on running faces. Those areas which are

ground have N5 surface finish. Other areas have a chemical black finish.

Stainless steel version

Material and finish: Special martensitic stainless steel conforming generally to AISI 420 series,

ground on all main surfaces to N5. Hardened on running faces.

Bearings & Track Rollers

Bearings rings, balls & rollers: Carbon-chromium bearing steel AISI 52100, hardened and tempered.

Seals: Nitrile rubber.

Cage: Plastic, Metal for ..HJR150.. & ..HRR144.. Studs: High tensile steel. Chemical black finish.

Temperature range: -20°C to +120°C

Stainless steel version

Bearings rings, balls & rollers: Stainless steel AISI 440C, hardened and tempered.

SS.HJR150.. & SS.HRR144.. contain a steel twin taper roller bearing.

Seals: Nitrile rubber.

Cage: Plastic.

Studs: Stainless steel AISI 303.
Temperature range: -20°C to +120°C

Carriage Plates & Back Plates

Material: High strength aluminium alloy.
Finish: Clear anodised to 15µm thickness.

Cap Wipers & Lubricators

Material: Body: Impact resistant plastic.

Wipers: Felt.

Fixings: Stainless steel grades AISI 304 or 316.

Temperature range: -20°C to $+60^{\circ}\text{C}$.

Lubricants: Small series bearing cap wipers.

Large series bearing cap wipers, all roller 1

cap wipers and all lubricators.

Grease NLGI consistency No. 2.

Oil 68 cSt or similar. Food compatible lubricants may also

be used.

Frictional Resistance for 'V' Slide Systems

Coefficient of friction (without cap wiper or lubricators) = 0.02.

Cap seals and lubricators add friction as follows.

4 Cap wipers per carriage CW64 or CW95 = 5N

CW120, CW128 or CW150 = 10N

4 Lubricators per carriage HDLB25 = 2.5N

HDLB33 = 5 N

Maximum Linear Speeds

HDS2 V slide and flat track system can operate at very high speeds, up to 10m/s in some instances. Speeds are dependent on stroke, duty and environmental conditions. Please contact Hepco to discuss application requirements. Stated speeds do not apply to rack driven systems.

Tightening Torques

Please visit our website <u>www.HepcoMotion.com/hdsdatauk</u> and select datasheet No. 7 HDS2 Fixing of Slides and Bearing Elements.
